

## Zeloviak Canine Rehabilitation Aids

Two years ago, our Dobermann, Zak was left totally paralysed following spinal surgery. We were horrified by the inferior quality and poor design of the harnesses commercially available; little or no thought had been given to the dogs' comfort and the restrictions being placed on the dogs by the very items that were supposed to be helping them. Encouraged by our Neurologist, we developed our ideas and the aids have been thoroughly tested in the leading referral hospitals in the UK and are used and recommended by vets, physiotherapists, hydro-therapists and people like you & us; ordinary owners trying to help their beloved dog.

### WalkeeZ

Registered Design Number: 3018414

Front "comfort" walking harness for exercising dogs recovering from surgery and those that require additional front support

Offering control and support to animals who may have a tendency to "race away" following surgery, this front harness evenly distributes the dogs weight across the chest area, avoiding any strain on the neck or back.

A simple "walk-in" design with single quick release fastening and total adjustability ensures the dog is both comfortable and secure.

Freedom of movement with minimal shoulder restriction; the Walkeez can safely be left on the dog whilst free running.

Used together with the Shortz a convalescing animal has freedom and independence whilst being supported and controlled.

All of our products are manufactured to a very high standard, in the UK, from neoprene material, using the finest quality, high tensile fittings available. The neoprene is both cushioning and comfortable; it moulds itself well to the wearer whilst providing much needed support. Neoprene is a non-breathable material.

All the garments can be machine washed at 40oC on a reduced agitation cycle. The neoprene material will dry very quickly at room temperature or on a domestic washing line, making them extremely economical to keep clean and hygienic.

# ShortZ

Registered Design Number: 3016132

Rear Harness support for dogs that are unable to support their own weight for extended periods. The shortz are designed to support the dogs weight from directly beneath the pelvis; this area is double thickness to help prevent discomfort. Suitable for both dogs and bitches, it enables dogs to urinate and defecate without restriction.

A top flap affords protection for operation sites with two adjustable, quick release fastenings. Adjustable handles are supplied with comfort pads.

The Shortz provide freedom of movement for both dog and handler; with less back strain, compared to using a conventional sling.

# HarneZ

Registered Design Number: 3016131

Full body support harness for dogs suffering from paralysis or who are unable to support their own weight.

Designed to evenly distribute the weight of the dog from the sternum, along the length of the ribcage. Double thickness lining along the bottom of the harness allows the dog to be lifted and moved in total comfort.

A top flap offers protection to operation sites with two adjustable elasticated quick release fasteners; the harness can easily be fitted from either side to a prone animal. All handles are independently adjustable for ease of use and are fitted with comfort pads.

# SlingZ

Supporting sling for dogs unable to walk unaided or convalescing following surgery

Conventional sling designed to be less restrictive of rotary movement around the stifle area. Adjustable handles fitted with comfort pads.
